## ISOQUINOLINE-5-SULFONIC ACID AMIDES AS INHIBITORS OF AKT (PROTEIN KINASE B)

The present invention provides compounds of Formula (I), compositions thereof, and a method of inhibiting Protein Kinase B (Akt) that comprises administering to a patient in need thereof an effective amount of a compound of Formula (I). In addition, the present invention relates to processes for preparing the compounds of Formula (I) and intermediates thereof.

### BACKGROUND OF THE INVENTION

Protein kinases are involved in the signal transduction pathways linking growth factors, hormones and other cell regulation molecules to cell growth, survival and metabolism under both normal and pathological conditions. One such protein kinase, protein kinase B (also known as Akt), is a serine/threonine kinase that plays a central role in promoting the proliferation and survival of a wide range of cell types, thereby protecting cells from apoptosis (programmed cell death) (Khwaja, *Nature* 33-34 (1990)). Three members of the Akt/PKB subfamily of second-messenger regulated serine/threonine protein kinases have been identified and are termed Akt1/PKB $\alpha$ , Akt2/PKB $\beta$ , and Akt3/PKB $\gamma$ . A number of proteins involved in cell proliferation and survival have been described as substrates of Akt in cells. Two examples of such substrates include glycogen synthase kinase-3 (GSK3) and Forkhead transcription factors (FKs). See Brazil and Hemmings, *Trends in Biochemical Sciences* 26, 675-664.

A number of protein kinases and phosphatases regulate the activity of Akt. For instance, activation of Akt is mediated by phosphatidylinositol 3-kinase (PI3-K), which initiates the binding of second messenger phospholipids to the pleckstrin homology (PH) binding domain of Akt. The binding anchors Akt to plasma membrane and results in phosphorylation and activation of the enzyme. Amplifications of the catalytic subunit of PI3-K, p110 $\alpha$ , or mutations in the PI3-K regulatory subunit, p85 $\alpha$ , lead to activation of Akt in several types of human cancer. (Vivanco and Sawyers, *Nature Reviews in Cancer* (2002) 2: 489-501.

The tumor suppressor, PTEN, is a critical negative regulator of Akt activation by PI3-K. Myers *et al.* *Proc. Nat. Acad. Sci. USA* (1998) 13513-13518. Inactivating mutations in the *Pten* gene have been found at high frequencies in a large number of human tumors and tumor cell lines, including prostate cancer, breast cancer, ovarian cancer, glioblastoma, melanoma and other cancer types. Inactivation of the PTEN protein results in elevated levels of phosphorylated Akt and increased Akt activity in tumor cells. Li, *et al.*, *Science* (1997) 275: 1943-1947; Guldberg, *et al.*, *Cancer Research* (1997) 57: 3660-3663; Risinger, *et al.*, *Cancer Research* (1997) 57: 4736-4738; Vivanco and Sawyers, *Nature Reviews in Cancer* (2002) 2: 489-501. In addition to overactivation of Akt due to defects in PTEN, direct amplification and/or overexpression of Akt2 and Akt3 have been found in human neoplasia, for example ovarian, pancreatic, prostate and breast cancer cells (Cheung *et al.*, *Proc. Nat. Acad. Sci. USA* (1992) 89:9267-9271; Cheung *et al.*, *Proc. Nat. Acad. Sci. USA* (1996) 93:3636-3641; Nakatani *et al.*, *J. Biol. Chem.* (1999) 274:21528-21532).

The critical role of Akt in cell proliferation and survival is further strengthened by studies showing that germline knockout of Akt1 results in partial embryonic lethality. The surviving littermates display stunted growth, increased organismal apoptosis, and early deaths. (Cho *et al.*, *J. Biol. Chem.* (2001) 276: 38349-38520; Chen *et al.*, *Genes Dev.* (2001) 15: 2203-2208). It has also been demonstrated that pharmacological inactivation of Akt induces apoptosis in cultured human ovarian cancer cells (Yuan *et al.*, *Oncogene* 19, 2324-2340, 2000) and decreases growth of a human ovarian carcinoma xenograft in mice (Hu *et al.*, *Clin. Cancer Res.* 6, 880-886, 2000).

Recent studies have also demonstrated the role of the PI3-K/AKT pathway in the life cycle of numerous viruses. Some viral proteins have been shown to directly activate the PI3-K/Akt pathway, thus providing an environment favorable for viral replication. These include the Tat protein of human immunodeficiency virus (HIV), Protein X of hepatitis B virus, and NS5A of hepatitis C virus (Borgatti *et al.*, *Eur. J. Immunol.* (1997) 27: 2805-2811; Lee *et al.*, *J. Biol. Chem.* (2001) 276: 16969-16977; He *et al.*, *J. Virol.* (2002) 76: 9207-9217). The PI3-K/Akt pathway is also required for initiation and completion of the replication cycle of human cytomegalovirus (HCMV). In fact, pharmacological inactivation of this pathway results in abortive production of HCMV and survival of the host cells (Johnson *et al.*, *J. Virol.* (2001) 75: 6022-6032).

-3-

Because of its pivotal role in the regulation of cell survival, Akt provides a novel therapeutic target for the effective treatment of various disorders, particularly cancer and viral infections. However, such treatment requires the development of potent, selective inhibitors of Akt. Thus, the present invention provides a class of novel inhibitors of Akt,  
 5 compositions comprising these compounds, and methods of using the compounds.

5           The skilled artisan will appreciate that additional preferred embodiments may be selected by combining the preferred embodiments above, or by reference to the examples given herein.

          The compounds of the present invention can be prepared by a variety of procedures, some of which are illustrated in the schemes and examples below. The  
10   schemes and examples should in no way be understood to be limiting in any way as to how the compounds may be made.

          The skilled artisan will appreciate that the introduction of certain substituents will create asymmetry in the compounds of Formula (I). The present invention contemplates all stereoisomers, enantiomers, and mixtures of enantiomers, including racemates and  
15   diastereomers. It is preferred that the compounds of the invention containing chiral centers are single enantiomers.

          It will be recognized by one of skill in the art that the individual steps in the following schemes may be varied to provide the compounds of Formula (I). The particular order of steps required to produce the compounds of Formula (I) is dependent  
20   upon the particular compound being synthesized, the starting compound, and the relative lability of the substituted moieties.

Scheme 1

As depicted in Scheme 1, step a, a two-step procedure is used to give compounds of Formula (I) in which R<sup>2</sup> and R<sup>3</sup> are hydrogen. The compound of Formula (10) is added to a stirred mixture of 4Å molecular sieve and the compound of Formula (4) in anhydrous CH<sub>3</sub>OH, followed by stirring for 16 hours to form imines *in situ*. Without isolation, the imines are reduced to the corresponding desired amines by sodium borohydride. The product of Formula (I) can be isolated and purified by techniques well known in the art, such as precipitation, filtration, extraction, evaporation, trituration, chromatography, or recrystallization.

Alternatively, as shown in step b, a compound of Formula (2) is coupled with a compound of Formula (5) to give compounds of Formula (I). The skilled artisan will appreciate that compounds of Formula (5) may be prepared by following known literature

procedures. See Pharmazie, (1980) 35(2): 80-84. Thus *O*-alkylation of commercial phenols with methyl bromoacetate, DIBAL-H reduction, mesylate formation, ethanolamine displacement and thionyl chloride reaction give compounds of Formula (5).

5

As shown in Scheme 2, step c, the compounds of Formula (2) are prepared by addition of the isoquinoline compound of Formula (1) to the appropriate alkylamine in a solvent, such as  $\text{CH}_2\text{Cl}_2$ . The product is isolated and purified by techniques well known to the skilled artisan, as described above.

The compounds of Formula (4) may be made directly from the isoquinoline of Formula (1), as shown in step d. The isoquinoline sulfonyl chloride of Formula (1) is added in small portions to a stirred solution of ethylenediamine in a solvent such as  $\text{CH}_2\text{Cl}_2$ , THF, 1,4-dioxane, or preferably,  $\text{CHCl}_3$ . The mixture is filtered, dried, and chromatographed by methods well known to the skilled artisan to give the compound of Formula (4).

Alternatively, the compound of Formula (1) may be added to a solution of (2-amino-ethyl)-carbamic acid *tert*-butyl ester and TEA, pyridine, or N,N-diisopropylethylamine in anhydrous CH<sub>2</sub>Cl<sub>2</sub> under N<sub>2</sub>. The mixture is stirred at ambient temperature for about 4 hours. The mixture is filtered, dried, and chromatographed by methods well-known to the skilled artisan to give the compound of Formula (3).

The compound of Formula (3) is de-protected by methods well known to the skilled artisan, as depicted in Step f.

Scheme 3

Compounds of Formula (10) may be prepared by a variety of routes, as depicted in Scheme 3. A brief description of each route is given below.

In step g, potassium carbonate is added to a solution of Formula (6) and methyl bromoacetate in a solvent such as acetonitrile, or preferably DMF. The mixture is extracted by standard techniques, for example with ethyl acetate/water or with xylene.

The product is dried, filtered, concentrated, and chromatographed by techniques well known in the art.

The skilled artisan will recognize that when R<sup>6</sup> is a suitable leaving group, such as bromo, the substituent may be transformed to other R<sup>6</sup> groups, such as phenyl, isoxazolyl, 5 furyl, or thienyl by Suzuki coupling methodology.

In step h, DIBAL-H is added dropwise to a solution of the compound of Formula (7) in a solvent, preferably CH<sub>2</sub>Cl<sub>2</sub>, at -78°C under N<sub>2</sub>. The solution is stirred, followed by addition of methanol and diethyl ether. The cold bath is removed, and a HCl solution is added in small portions. The organic layer is separated, dried, filtered and concentrated 10 to give the compound of Formula (10) and its methyl hemiacetal.

Alternatively, as shown in step i, DIBAL-H is added dropwise to a stirred solution of the compound of Formula (8) in anhydrous CH<sub>2</sub>Cl<sub>2</sub>, preferably at -78°C, under N<sub>2</sub>. The solution is then stirred at 0°C for 1-2 hours. The reaction is quenched with addition of MeOH, followed by successive additions of diethyl ether and HCl in small portions. 15 The organic layer is separated, dried, filtered and concentrated by techniques well known to the skilled artisan.

Compounds of Formula (6) may also be transformed to compounds of Formula (10) via the diethoxy compound of Formula (9). Briefly, as shown in step j, potassium carbonate is added to a solution of the compound of Formula (6) and bromoacetaldehyde 20 diethyl acetal in a solvent such as DMF. The mixture is stirred at 85°C under N<sub>2</sub> for about 72 hours. The mixture is cooled to ambient temperature, followed by addition of water and EtOAc. The compound of Formula (9) is separated, dried, filtered, and concentrated by techniques well known to the skilled artisan.

As depicted in step k, to a stirred solution of the compound of Formula (9) in 25 diethyl ether is added HCl. The solution is stirred vigorously, with subsequent addition of diethyl ether in order to drive the reaction. The reaction of step k gives the product of Formula (10) and its ethyl hemiacetal.

Similarly, by use of the appropriate starting materials, as would be known by 30 those skilled in the art, compounds wherein R<sup>6</sup> is an amine or amide may also be prepared.

## PREPARATIONS

### Preparation 1

#### Isoquinoline-5-sulfonyl chloride hydrochloride

5

Anhydrous DMF (1.5 mL) is added dropwise to a stirred suspension of isoquinoline-5-sulfonic acid (28.3 g, 135 mmol) in thionyl chloride (150 mL, 2.06 mole) at ambient temperature under nitrogen. The resultant mixture is heated to reflux for 2.5 hours. After being cooled to ambient temperature, the mixture is concentrated under vacuum to give a yellowish powder. The powder is suspended in dry CH<sub>2</sub>Cl<sub>2</sub> (200 mL), sonicated, filtered and dried at 40° C under vacuum to give 29.2 g (111 mmol, 82% yield) of the title compound. <sup>1</sup>H NMR (TFA-d<sub>1</sub>): δ 8.48 (t, *J* = 7.9 Hz, 1H), 9.13-9.14 (m, 2H), 9.29 (d, *J* = 7.9 Hz, 1H), 9.57 (d, *J* = 7.0 Hz, 1H), 10.26 (s, 1H).

### Preparation 2

#### Isoquinoline-5-sulfonic acid (2-amino-ethyl)-amide

Powdered isoquinoline-5-sulfonyl chloride hydrochloride (5.57 g, 21.1 mmol) is added in small portions to a stirred solution of ethylenediamine (45.0 mL, 673 mmol) in CHCl<sub>3</sub> (400 mL) at ambient temperature under nitrogen. The resultant mixture is stirred for 1 hour. After filtration and concentration *in vacuo*, the crude product is chromatographed on silica (gradient 5-10% CH<sub>3</sub>OH in CH<sub>2</sub>Cl<sub>2</sub>, then 0-16% 2M NH<sub>3</sub>/CH<sub>3</sub>OH in CH<sub>2</sub>Cl<sub>2</sub>) to give 4.71 g (18.7 mmol, 89% yield) of the title compound. ESIMS: *m/z* 252 (M+H)<sup>+</sup>.

### Preparation 3

#### (2-bromo-phenoxy)-acetic acid methyl ester

Powdered potassium carbonate (3.84 g, 27.8 mmol) is added to a stirred solution of 2-bromophenol (3.20 g, 18.5 mmol) and methyl bromoacetate (3.11 g, 20.3 mmol) in anhydrous DMF (20 mL). The resultant mixture is stirred at ambient temperature under nitrogen for 16 hours. Water (140 mL) and EtOAc (120 mL) are added to the mixture

30

and the two-layered solution is stirred vigorously for 3 minutes. The organic layer is separated, dried over  $\text{MgSO}_4$ , filtered and concentrated. The crude product is chromatographed on silica (gradient 2-8% EtOAc in hexane) to give 4.39 g (17.9 mmol, 97% yield) of the title compound. Diisobutylaluminum hydride (DIBAL-H, 1.0M in toluene, 8.32 mL) is added dropwise to a stirred solution of (2-bromo-phenoxy)-acetic acid methyl ester (1.70 g, 6.94 mmol) in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (15 mL) at -78 °C under nitrogen. The resultant solution is stirred at -78 °C for 1 hour. Methanol (2 mL) is added dropwise to the mixture, followed by the addition of Et<sub>2</sub>O (25 mL). Cold bath is removed, and a 2.5N HCl solution (33 mL) is added in small portions to the cold mixture. The organic layer is separated, dried over MgSO<sub>4</sub>, filtered and concentrated at ambient temperature to give 1.50 g of a ~50:50 mixture of (2-bromo-phenoxy)-acetaldehyde and its methyl hemiacetal as oil. The oil is diluted in Et<sub>2</sub>O to form a stock solution (80 mg/mL), which is used for the subsequent reaction. <sup>1</sup>H NMR (CDCl<sub>3</sub>) ((2-bromo-phenoxy)-acetaldehyde): δ 3.52 (s, 2H), 9.90 (s, 1H); (methyl hemiacetal): δ 3.48 (s, 1H), 4.05 and 4.10 (br AB, J = 9.6 Hz, 2H), 4.62 (s, 3H), 4.91 (br s, 1H).

Example 78

Isoquinoline-5-sulfonic acid {2-[2-(4-bromo-2-methyl-phenoxy)-ethylamino]-ethyl}-amide di-hydrochloride

20

A 5N HCl (15 mL) solution is added to a stirred solution of 4-bromo-1-(2,2-dimethoxy-ethoxy)-2-methyl-benzene (1.40 g, 5.09 mmol) in Et<sub>2</sub>O (25 mL). The two-layered solution is stirred vigorously at ambient temperature under nitrogen for 2 days. Et<sub>2</sub>O (50 mL) and saturated aqueous NaCl solution (25 mL) are added to the mixture.

-63-

The organic layer is separated, washed with a half-saturated aqueous NaCl solution (30 mL) containing saturated NaHCO<sub>3</sub> (0.5 mL), dried over MgSO<sub>4</sub>, filtered and concentrated at ambient temperature to give 1.36 g of the crude (4-bromo-2-methyl-phenoxy)acetaldehyde as oil. The oil is diluted in Et<sub>2</sub>O to form a stock solution (67 mg/mL), which is used for the subsequent reaction.

A 7.4 mL of the above stock solution (~1.1 mmol) is added to a stirred mixture of 4Å molecular sieve (600 mg) and isoquinoline-5-sulfonic acid (2-amino-ethyl)-amide (247 mg, 0.983 mmol) in anhydrous CH<sub>3</sub>OH (8 mL), and the resultant mixture is stirred at ambient temperature for 16 hours. The mixture is cooled to 0 °C before it is treated with powdered sodium borohydride (82 mg, 2.2 mmol). The mixture is stirred at 0 °C for 1 hour then at ambient temperature for another 1 hour. After filtration and subsequent concentration *in vacuo*, the gummy product is chromatographed on silica (gradient 5-30% CH<sub>3</sub>OH in EtOAc) to give 326 mg (0.702 mmol, 71% yield) of the free amine product as oil. The free amine (324 mg, 0.698 mmol) is dissolved in CH<sub>2</sub>Cl<sub>2</sub> (25 mL) and treated dropwise with 1N HCl/Et<sub>2</sub>O solution (2.09 mL) with stirring under nitrogen. The white suspension is stirred for 15 minutes, filtered and dried under vacuum at 60 °C to give 345 mg (0.642 mmol, 92% yield) of the title compound as a white powder. ESIMS: m/z 464 [(M+H)<sup>+</sup>, <sup>79</sup>Br], 466 [(M+H)<sup>+</sup>, <sup>81</sup>Br]. di-hydrochloride (152 mg, 0.380 mmol), 4Å molecular sieve (300 mg) and NEt<sub>3</sub> (0.212 mL, 1.52 mmol) in anhydrous CH<sub>3</sub>OH (4 mL) at ambient temperature under nitrogen. The resultant mixture is stirred for 16 hours. Then the mixture is cooled to 0 °C before it is treated with powdered sodium borohydride (43.1 mg, 1.14 mmol). The mixture is stirred at 0 °C for 1 hour, then at ambient temperature for another 1 hour. After filtration and subsequent concentration *in vacuo*, the crude product is chromatographed on silica (gradient 5-25% CH<sub>3</sub>OH in EtOAc) to give 104 mg of the free amine product as a gum (0.216 mmol, 57% yield). The free amine (102 mg, 0.212 mmol) is dissolved in EtOAc (15 mL) and treated dropwise with 1N HCl/Et<sub>2</sub>O solution (0.635 mL) with stirring under nitrogen. The white suspension is stirred for 15 minutes, filtered and dried under vacuum at 60 °C to give 112 mg (0.202 mmol, 95% yield) of the title compound as a white powder. Example 140

Isoquinoline-5-sulfonic acid {2-[2-(5,2'-difluoro-biphenyl-2-yloxy)-ethylamino]-ethyl}-  
amide di-hydrochloric acid

Aqueous sodium carbonate (0.18 mL, 2.0 M) is added to a stirred solution of [2-(2-bromo-4-fluoro-phenoxy)-ethyl]-[2-(isoquinoline-5-sulfonylamino)-ethyl]-carbamic acid *tert*-butyl ester (0.101 g, 0.179 mmol), 2-fluorophenyl boronic acid (26 mg, 0.19 mmol), Pd(dppb)<sub>2</sub>Cl<sub>2</sub> (43 mg, 0.072 mmol) in DMF (3 mL)/ MeOH (0.8 mL). The resultant mixture is heated at 80 °C under argon for 16 hours. At ambient temperature ethyl acetate (10 mL) and brine (3 mL) are added to the mixture, the organic layer is separated, dried, filtered and concentrated. After MPLC separation on silica (gradient 0-1% methanol in methylene chloride), 90 mg (86% yield) of the BOC-protected title compound is obtained. The precursor is dissolved in methylene chloride (10 mL), then a small stream of anhydrous HCl gas is bubbled through the solution for 1 minute. The solution is capped with a glass stopper and allowed to stir for 1 hour to form a suspension.

After filtration and drying, 70 mg (86% yield) of the title compound is obtained as a solid.  
ESIMS:  $m/z$  484  $(M+H)^+$ .

### Akt1 Phosphorylation Assay

The assay described measures the phosphorylation of Crosstide by active human Akt1 and other Akt isoforms. Crosstide contains a consensus sequence derived from Akt substrates GSK3b and forkhead transcription factors (FKs). The  $^{33}\text{P}$ -labeled Crosstide substrate is captured by phosphocellulose membrane filter plates.

#### Enzyme and Substrate

Active human recombinant Akt1 (full-length) purified from Sf9 insect cells is from Upstate Biotechnology, Inc. (Cat. #14-276, 405  $\mu\text{g/ml}$ ). Crosstide substrate,  $\text{NH}_2$ -GRPRTSSFAEG-COOH (M.W.1164) is purchased from Multiple Peptide System (Cat. # L59/GR145-153).

#### Standard Assay Solutions

Solution (A): 20% DMSO (dimethylsulphoxide) or Compound in 20% DMSO; Solution (B): Assay Buffer Mix: 31.25  $\mu\text{M}$  Crosstide, 37.5 mM  $\text{MgCl}_2$ , 87.5 mM HEPES, pH 7.3, 50  $\mu\text{M}$  ATP  $\gamma$ - $^{33}\text{P}$ -ATP, 0.05 $\mu\text{Ci}/\mu\text{l}$ ; Solution (C): Akt Kinase Mix: 31.25 mM HEPES, pH 7.3; 1 mM DTT, 25 nM UBI Akt1.

#### Procedure for Phosphocellulose Filter-Binding Assay

Ten  $\mu\text{l}$  of Solution (A) are first mixed with 20  $\mu\text{l}$  Solution (B). The enzymatic reaction is initiated by adding 20  $\mu\text{l}$  Solution (C) to the mixture. (Final concentration or amount in a 50- $\mu\text{l}$  reaction mix: 4% DMSO or various compound concentration in 4% DMSO; 12.5  $\mu\text{M}$  Crosstide; 15 mM  $\text{MgCl}_2$ ; 35 mM HEPES, pH7.3; 20  $\mu\text{M}$  ATP; 1  $\mu\text{Ci}$   $\gamma$ - $^{33}\text{P}$ -ATP; 0.4 mM DTT; 10 nM UBI Akt1.) The reactions are performed in 96-well microtiter plates.

After 30 minutes at room temperature, the reaction is terminated by adding 80  $\mu\text{l}$  of 10%  $\text{H}_3\text{PO}_4$ . An aliquot of 100  $\mu\text{l}$  from each well is transferred to the phosphocellulose filter plate (Millipore MultiScreen, Catalog #MAPHN0B50). After 30 minutes, the reaction mix is filtered with a Millipore manifold following by 3 washes with 0.5%  $\text{H}_3\text{PO}_4$ . The filter is then vacuum-dried and the plate is fitted onto a Packard

#### Cell-Based Target Inhibition Assay

As substrates of Akt, the family of forkhead transcription factors (FKs) includes three members: FKHRL1, FKHR and AFX. They share a high degree of sequence  
10 homology and are involved in the transcription of pro-apoptotic genes. There are three sites for phosphorylation by Akt: T32/S253/S315 in FKHRL1, T24/S256/S318 in FKHR and T28/S193/S258 in AFX. When phosphorylated, FKs are translocated from nucleus to cytoplasm, thus rendered non-functional.

The following experimental protocol is designed to validate the mechanism of  
15 action of Akt inhibitors in cells by measuring the level of inhibition of FK phosphorylation. Ideally, an Akt inhibitor should inhibit the level of FK phosphorylation in a dose-dependent manner, with little effect on the level of phospho-Akt, total Akt or total FK.

Akt1 activity requires phosphorylation at residues T308 and S473. The status of  
20 phospho-S473 is used to monitor level of phospho-Akt. Complete inactivation of FK proteins as transcription factors requires phosphorylation of three sites, T32, S253 and S315. The status of phospho-T32 is used to monitor the level of phospho-FK in cells.

#### 15 Experimental Protocol:

##### (A) Treatment of cells with Akt1 inhibitors and preparation of cell lysates:

Target cells (e.g. MDA-MB-468, U87MG, American Type Culture Collection, ATCC) from an exponentially growing culture are plated at  $2 \times 10^6$  per 10-cm plate in 10 ml culture media and incubated at 37°C. On the day of treatment, the overnight culture  
20 media is replaced with 10 ml of fresh media. Serial dilutions of test compounds are made in 100% DMSO. The volume of each dilution added to the culture should be less than 50 µl so that final DMSO concentration does not exceed 0.5%. An equivalent volume of DMSO is added to the sham-treated control, and a positive control prepared in the same  
25 washing with ice-cold PBS (phosphate-buffered saline), cells are lysed with 100 µl of RIPA buffer (50 mM TRIS pH 7.4, 150 mM NaCl, 1 mM EDTA, 1% NP-40, 0.25% sodium deoxycholate, 1 mM NaF, 1 mM Na<sub>2</sub>VO<sub>4</sub>, and Roche Protease Inhibitor Cocktail tablet, Cat. # 1836170). After removal of the particular fraction, the protein concentration in the cytoplasmic extracts is determined using Pierce BCA assay in microtiter format  
30 with BSA as a standard. After adjusting protein concentration, aliquots of the cell lysates are mixed with 4X gel sample buffer (3:1) and stored in -80°C freezer. (4x gel sample

-104-

buffer contains 0.25M Tris-HCl, pH 6.8; 40% glycerol; 8% sodium dodecyl sulfate, 0.02% bromophenol blue; and 1.0M 2-mercaptoethanol)

(B) Electrophoresis and Immunoblotting Procedures:

5 After brief heating at 100<sup>0</sup> C, equal amounts of cell lysates in gel sample buffer are loaded on 8-16% gradient gels. Electrophoresis is performed by standard procedure. Separated proteins in the gels are transferred to 0.2-micron nitrocellulose membranes using Invitrogen Transfer Buffer (Invitrogen, Cat. #LC3675) adjusted to contain 20% methanol. The blots are blocked with 5% non-fat Carnation milk in TBS/Tween 20 and  
10 probed with the primary antibody diluted in 5% milk in TBS/Tween overnight at 4°C. After washings with TBS/Tween, the secondary antibody diluted in 5% milk in TBS/Tween 20 and incubated for 60 min at room temperature. The blots are washed with TBS/Tween and water, and then immersed in Pierce Super Signal West Durra Extended Duration chemiluminescent substrate (Pierce, Cat. # 34075), following vendor's  
15 procedure. X-ray films are then exposed to the blots for a short time (10-120 seconds). The intensity of the protein bands of interest is scanned with a Flour-S-MultiImager and quantityOne Software (BioRad).

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US2004/006093

### Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 13, 14  
because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 13 and 14 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

### Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

#### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
